

New HST front stub axle by OTK Kartparts

OTK, department related to research and development of all the high-technology components used by Tony Kart, Kosmic Kart and FA Kart, produced a brand new HST front stub axle intended to the KZ category. The new technical item is also born from the recent experiences in the KF1 category.

The HST stub axle stands out for having a 25mm \varnothing pivot, coupled with a new Ergal disc's hub that replace the old aluminium one in use from 2004. this new solution stiffens the front end, giving much more stability on the curves and increases the precision while racing.

Among the qualities of the HST there is also the perfect compatibility with the BS5 125 calliper, so that you can easily interchange between the new stub axle and the ones already produced by OTK. The new HST stub axle represents another way to optimize the set-up. Before launch, the HST project, was tested by the drivers of our Racing Team, giving very positive data, both in terms of performance and reliability.
